PowerLever Exit Trim Series—For use with Monarch Series R-18 & R18-F Rim Exit Devices

INSTALLATION NOTICE: Outside Back Plate Assembly (416003) Excess Stud Removal

Refer to the illustration figure 5, on page 8 of the PowerLever Installation Guide:

-Attached to the PowerLever Outside Cover Assembly is the Outside Back Plate Assembly, which has attached to it 8 internally threaded studs used to mount the Exit Device to the PowerLever. Although 8 studs are depicted and existing, only 6 studs are actually required for any given installation. The purpose of using 8 studs is to accommodate either a LHRB or a RHRB mounting scenario. All installation procedures will remain the same except as noted in the “Special Time Saving Consideration” statement below.

SPECIAL TIME SAVING CONSIDERATION (Modification of Back Plate Assembly):

The Design of the Outside Back Plate Assembly is such that it will accommodate both a RHRB and/or a LHRB installation. If elected, a shortcut is possible by removing the Back Plate Assembly from the back of the Outside Cover (held on by Qty. 3 - #6-32 screws), then knocking out the 2 studs that will not be used for the given installation. The Back Plate Assembly is then re-installed to the Outside Cover with the Qty. 3 - #6-32 screws. Use caution not to pinch the system cable or the solenoid lead wire. However, special consideration is required. Once the studs are knocked out, it will be impossible to use the Back Plate for the opposite handed installation. A hammer is required to knock out the studs which are press fitted to the plate. This will reduce the number of holes required to be drilled into the door, thus saving time.

Warranty Exception-Election of stud removal, as stated above, ***will not*** void the Mas-Hamilton Group, Inc. PowerLever Lock Series Limited Product Warranty
